

Lab: Design and implement a basic SQL schema using SQL Server, with tables and relationships

This guide will walk you through the process of connecting to a SQL Server instance using SSH and designing a basic SQL schema with tables and relationships. Follow these steps carefully to complete the process.

Step 1: Open Terminal and Connect via SSH

1. Open a terminal on your local machine.
2. Use the following command to connect to the remote machine via SSH:

```
ssh username@remote_host
```

Replace `username` with your SSH username and `remote_host` with the IP address or hostname of the remote machine.

3. If prompted, enter your SSH password to establish the connection.
4. The server is ready for connections once the SQL Server error logs display the message: SQL Server is now ready for client connections. This is an informational message; no user action is required. You can review the SQL Server error log inside the container using the command:

```
docker exec -t sql1 cat /var/opt/mssql/log/errorlog | grep connection
```

```
WKS@STDP-8111100 MINGW64 /e/work/software-dev-ecosystem (main)
$ ssh Fenago20.9.137.222
Fenago20.9.137.222's password:
Welcome to Ubuntu 22.04.1 LTS (GNU/Linux 6.8.0-1020-azure x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/pro

System information as of Sun Jan 26 13:04:35 UTC 2025

System load:  0.36      Processes:    128
Usage of /:   24.2% of 61.84GB    Users logged in:  0
Memory usage: 13%      IPv4 address for eth0: 10.2.0.4
Swap usage:   0%

 * Strictly confined Kubernetes makes edge and IoT secure. Learn how MicroK8s
   just raised the bar for easy, resilient and secure K8s cluster deployment.
   https://ubuntu.com/engage/secure-kubernetes-at-the-edge

Expanded Security Maintenance for Applications is not enabled.

3 updates can be applied immediately.
To see these additional updates run: apt list --upgradable

Enable ESM Apps to receive additional future security updates.
See https://ubuntu.com/esm or run: sudo pro status

New release '24.04.1 LTS' available.
Run 'do-release-upgrade' to upgrade to it.

Last login: Sun Jan 26 12:34:29 2025 from 139.135.39.206
Fenago@software-ecosystem-ubuntu22:~$ docker exec -t sql1 cat /var/opt/mssql/log/errorlog | grep connection
2025-01-26 13:03:55.26 Server      The maximum number of dedicated administrator connections for this instance is '1'.
2025-01-26 13:03:58.49 Server      Dedicated admin connection support was established for listening locally on port 1434.
2025-01-26 13:03:58.51 spid25s     SQL Server is now ready for client connections. This is an informational message; no user action is required.
2025-01-26 13:04:02.22 spid48s     Always On: The availability replica manager is waiting for the instance of SQL Server to allow client connections. This is an informational message only. No user action is required.
Fenago@software-ecosystem-ubuntu22:~$
```

Step 2: Access the SQL Server Instance Using Docker

1. Once connected to the remote machine, access the SQL Server container using the following command:

```
docker exec -it sql1 "bash"
```

This will open a Bash shell inside the Docker container named `sql1`.

2. Use the following command to connect to the SQL Server instance:

```
/opt/mssql-tools18/bin/sqlcmd -S localhost,1433 -U SA -P SoftwareEcol23 -N -C
```

- `-S localhost,1433` : Specifies the server and port.
- `-U SA` : Specifies the username (System Administrator).
- `-P SoftwareEco123` : Specifies the password.
- `-N` : Ensures encryption of data.
- `-C` : Trusts the server certificate.

3. Once connected, you will see the `1>` prompt, indicating that you are ready to execute SQL commands.

```
fenago@software-ecosystem-ubuntu22:~$ docker exec -it sql1 "bash"
mssql@sql1:/$ /opt/mssql-tools18/bin/sqlcmd -S localhost,1433 -U SA -P SoftwareEco123 -N -C
1>
2> |
```

Step 3: Design a Basic SQL Schema

3.1 Create a Database

NOTE: When using `sqlcmd`, avoid directly pasting entire queries. Instead, copy and paste line by line or manually type the query into the command line. Directly pasting large blocks of queries might result in unexpected behavior.

1. Execute the following command to create a new database:

```
CREATE DATABASE MyDatabase;
GO
```

2. Switch to the newly created database:

```
USE MyDatabase;
GO
```

3.2 Create Tables

Table: `Users`

This table will store user information.

```
CREATE TABLE Users (
    UserID INT IDENTITY(1,1) PRIMARY KEY,
    Username NVARCHAR(50) NOT NULL,
    Email NVARCHAR(100) NOT NULL UNIQUE,
    PasswordHash NVARCHAR(256) NOT NULL,
    CreatedAt DATETIME DEFAULT GETDATE()
);
GO
```

```

1>
2>
3> USE MyDatabase;
4>
5> GO
Changed database context to 'MyDatabase'.
1> CREATE TABLE Users (
2>   UserID INT IDENTITY(1,1) PRIMARY KEY,
3>   Username NVARCHAR(50) NOT NULL,
4>   Email NVARCHAR(100) NOT NULL UNIQUE,
5>   PasswordHash NVARCHAR(256) NOT NULL,
6>   CreatedAt DATETIME DEFAULT GETDATE()
7> );
8> GO
1>

```

Table: Posts

This table will store posts created by users.

```

CREATE TABLE Posts (
    PostID INT IDENTITY(1,1) PRIMARY KEY,
    UserID INT NOT NULL,
    Title NVARCHAR(100) NOT NULL,
    Content NVARCHAR(MAX) NOT NULL,
    CreatedAt DATETIME DEFAULT GETDATE(),
    FOREIGN KEY (UserID) REFERENCES Users(UserID)
);
GO

```

Table: Comments

This table will store comments on posts.

```

CREATE TABLE Comments (
    CommentID INT IDENTITY(1,1) PRIMARY KEY,
    PostID INT NOT NULL,
    UserID INT NOT NULL,
    Content NVARCHAR(MAX) NOT NULL,
    CreatedAt DATETIME DEFAULT GETDATE(),
    FOREIGN KEY (PostID) REFERENCES Posts(PostID),
    FOREIGN KEY (UserID) REFERENCES Users(UserID)
);
GO

```

3.3 Verify the Schema

1. Use the following command to list all tables:

```

SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES WHERE TABLE_TYPE = 'BASE
TABLE';
GO

```

2. Use the following command to inspect the structure of a specific table:

```
EXEC sp_help 'TableName';  
GO
```

Replace `TableName` with the name of the table you want to inspect (e.g., `Users`).

Create an ASCII Representation of Relationships

Based on the relationships, here is ASCII-style diagram:

```
Users  
├── UserID (Primary Key)  
└── Posts  
    ├── PostID (Primary Key)  
    ├── UserID (Foreign Key → Users.UserID)  
    └── Comments  
        ├── CommentID (Primary Key)  
        ├── PostID (Foreign Key → Posts.PostID)  
        └── UserID (Foreign Key → Users.UserID)
```

Step 5: Test the Schema

5.1 Insert Sample Data

Insert Users

```
INSERT INTO Users (Username, Email, PasswordHash)  
VALUES ('john_doe', 'john.doe@example.com', 'hashed_password_123'),  
       ('jane_smith', 'jane.smith@example.com', 'hashed_password_456');  
GO
```

Insert Posts

```
INSERT INTO Posts (UserID, Title, Content)  
VALUES (1, 'First Post', 'This is the content of the first post.'),  
       (2, 'Second Post', 'This is the content of the second post.');  
GO
```

Insert Comments

```
INSERT INTO Comments (PostID, UserID, Content)  
VALUES (1, 2, 'Great post!'),  
       (2, 1, 'Thank you for sharing!');  
GO
```

```

3> INSERT INTO Users (Username, Email, PasswordHash)
4> VALUES ('john_doe', 'john.doe@example.com', 'hashed_password_123'),
5>         ('jane_smith', 'jane.smith@example.com', 'hashed_password_456');
6> GO
Changed database context to 'MyDatabase'.

(2 rows affected)
1>
2> INSERT INTO Posts (UserID, Title, Content)
3> VALUES (1, 'First Post', 'This is the content of the first post.'),
4>         (2, 'Second Post', 'This is the content of the second post. ');
5>
6> GO

(2 rows affected)
1>
2> INSERT INTO Comments (PostID, UserID, Content)
3> VALUES (1, 2, 'Great post!'),
4>         (2, 1, 'Thank you for sharing!');
5> GO

(2 rows affected)
1>

```

5.2 Query Data

1. Retrieve all users:

```

SELECT * FROM Users;
GO

```

2. Retrieve all posts with user information:

```

SELECT Posts.PostID, Posts.Title, Users.Username
FROM Posts
JOIN Users ON Posts.UserID = Users.UserID;
GO

```

3. Retrieve all comments for a specific post:

```

SELECT Comments.Content, Users.Username
FROM Comments
JOIN Users ON Comments.UserID = Users.UserID
WHERE Comments.PostID = 1;
GO

```

```

2> SELECT * FROM Users;
3>
4> GO
UserID      Username      Email
-----
1 john_doe      john.doe@example.com
2 jane_smith    2025-01-26 13:53:17.000 jane.smith@example.com
                2025-01-26 13:53:17.000

(2 rows affected)
1>
2> SELECT Posts.PostID, Posts.Title, Users.Username
3> FROM Posts
4> JOIN Users ON Posts.UserID = Users.UserID;
5>
6> GO
PostID      Title      Username
-----
1 First Post      john_doe
2 Second Post     jane_smith

(2 rows affected)
1>
2> SELECT Comments.Content, Users.Username
3> FROM Comments
4> JOIN Users ON Comments.UserID = Users.UserID
5> WHERE Comments.PostID = 1;
6> GO
Content      Username
-----
great post!  jane_smith

(1 rows affected)

```

Step 6: Exit the SQL Server and SSH Session

1. To exit the `sqlcmd` tool, type:

```
EXIT
```

2. To exit the Docker container, type:

```
exit
```

3. To disconnect from the SSH session, type:

```
exit
```

Conclusion

You have successfully connected to a SQL Server instance, designed a basic SQL schema, displayed relationships using CLI, and tested it with sample data. Use this foundation to build more complex schemas and applications.
